## **Pocomoke City**2008 Drinking Water Quality Report

PWSID: 023 0006

## **Important Information about your Drinking Water:**

## **Special points of interest:**

- The water at Pocomoke City was tested for over 120 different compounds
- The Pocomoke City Drinking water consistently met both State and Federal requirements
- Drinking Water, including bottled water, may reasonably be expected to contain at least small amounts of some compounds. The presence of these compounds does not necessarily indicate that water poses a health More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency (EPA) Safe Drinking Water Act Hotline (800-426-4791)

Ye're pleased to present to you the Annual Water Quality Report for 2008. This report is designed to inform you about the water quality and services we deliver to you every day. Maryland Environmental Service, an Agency of the State of Maryland operates the water treatment facility at Pocomoke City. Our goal is to provide you with a safe and dependable supply of drinking water. Last year more than 800 tests for over 120 compounds were conducted on the water at Pocomoke City. We want you to understand the efforts made to continually improve the water treatment process and protect our water resources. We are committed

to ensuring the quality of your water.

We're pleased to report that your drinking water consistently met both Federal and State requirements. This report shows the water quality and explains what it means.

If you have any questions about this report or have questions concerning your water utility, please contact Mr. Jay Janney of Maryland Environmental Service at 410-729-8350 or jiann@menv.com

We want everyone to be informed about their water.

The water for Pocomoke City comes from three wells located in the Pocomoke aquifer. After the water is pumped out of the well, we add disinfectant to protect against microbial contaminants. The Maryland Department of the Environment has performed an assessment of the source water.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain compounds in water provided by public water systems. We treat our water according to EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

ome people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

## **Water Quality Data**

The table below lists all the drinking water contaminants that we detected during the 2008 calendar year. The presence of these compounds in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the

data presented in the table is from testing done January 1 – December 31, 2008. The State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year.

Definitions				
Maximum Contaminant	The highest level of a contaminant that is allowed in drinking water. MCL's are set			
Level (MCL)	as close to the MCLGs as feasible using the best available treatment technology.			
Maximum Contaminant	The level of a contaminant in drinking water below which there is no known or			
Level Goal (MCLG)	expected risk to health. MCLGs allow for a margin of safety.			
Action Level	The concentration of a contaminant which, if exceeded, triggers treatment or			
M rostnoo saasta satilia sissa	other requirements which a water system must follow.			
ppm = parts per million or milligrams per	liter			
opb = parts per billion or micrograms per		CE COOR TOWN	TOTAL SECURIT SERVICE	Act of the section of the section
pCi/l = picocuries per liter (a measure of	radioactivity)	adan nuk zur i	arena dere sig	
mrem/year = millirems per year (a measu	re of radiation absorbed by th	e body)	pi to viq illi	
Contaminant	Highest Level	Highest Level	Ideal Goal	Typical
	Allowed	Detected	(EPA's MCLG)	Sources of
	(EPA's MCL)	NEW WATER TOWN	to the total of the	Contaminant
Regulated at the Treatment Plant - Poc	omoke City, Maryland	and the second

Copper	1.3 ppm (action level)	90th percentile = 0.205 ppm	1.3 ppm	Corrosion of household plumbing fixtures and systems
Lead	15 ppb (action level)	90th percentile = 3 ppb	0 ppb	Corrosion of household plumbing fixtures and systems

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases radioactive material, and can pick up substances resulting from the presence of animals or from human activity.
